

Digi-Tech

COMPANY PROFILE

Engineering digital products that **drive revenue,** **engagement, and scale**

Digi-Tech is a product engineering studio. We design, build and hand over the systems businesses run on — from customer-facing platforms to the operational software behind them.

COMPANY

Digi-Tech

FOCUS

Product engineering

WEBSITE

digital-tech.shop

A senior, hands-on engineering studio

Digi-Tech works with companies that have outgrown their first set of tools. Our work sits where design, engineering and operations meet: the products customers use, the admin systems that keep them honest, and the integrations that connect them to everything else.

We stay deliberately small. The people who scope your work are the people who build it — no account layers, no black-box delivery, no handoff into a junior production line.

Full-stack

Web, mobile, APIs, databases and deployment under one team

Ops-first

We build the admin and reporting layer, not just the pretty front end

Multi-tenant

Many brands or markets on one platform, cleanly isolated

Multi-currency

Production experience with USD/EGP pricing and staged revenue

Handover

Documented, tested and transferable to your team by design

What we exist to do

Mission

Build digital systems that turn ambition into measurable business results

We help organisations replace fragmented tools and manual process with software that converts, retains and scales — owned by the client, understood by their team, and fit for the way they actually operate.

Vision

Become the engineering partner companies trust when the product has to perform

We aim to be known for work that outlasts the engagement: clean architecture, honest delivery and systems that keep earning after we leave — so clients return when the next chapter of growth needs building.

03 — WHAT WE SPECIALISE IN

Five capabilities, one delivery team

We do not try to be everything. Our specialty is end-to-end product engineering — from the interface people touch to the infrastructure that keeps it reliable.

Product engineering

Web platforms

Customer-facing applications built for conversion and speed — booking flows, catalogues, checkout, dashboards and account areas — with design handled in-house rather than subcontracted.

Mobile

Applications

Customer and operations apps sharing one API and one design language, so the phone experience and the desktop experience never drift apart as features ship.

Integration

Systems & data

Making separate tools behave as one system: payment providers, carriers, catalogues, accounting and internal databases — with clear ownership of data and failure modes.

Automation

Workflow & AI

Removing repetitive human steps — classification, matching, reconciliation, alerting — where the rules are clear enough to encode and the volume makes it worth doing.

Architecture

Multi-tenancy

One platform serving many isolated tenants — separate brands, markets, franchises or partner accounts on shared infrastructure, with data, permissions, branding and reporting kept cleanly separated. Designed into the schema from day one, because retrofitting tenant isolation later is one of the most expensive rewrites a company can face.

Discovery to handover, without black boxes

Every engagement follows the same discipline: understand before building, show working software every week, and leave the client able to run what we shipped.

01

Discovery & strategy

Goals, audience, brand direction and technical scope — written down, not assumed.

02

UI/UX & prototype

A modern visual direction and interactive journey the client can react to early.

03

Build & integrate

Production-grade frontend and backend, tested, in the client's own repository.

04

Launch & support

Deploy, document, hand over — with a clear path for the client's team to continue.

Weekly demos

Working software every week. If there is nothing to show, we say so.

Your repository

Commits land in your GitHub from day one. Review anything, any time.

Direct access

You talk to the engineers doing the work — not a relay of account managers.

Written decisions

Architectural choices are documented with their trade-offs for future teams.

Systems we have shipped

A sample of live and production work. More detail is always available under NDA.

Live

El Fayrouz Travel

Booking and trip management for an Egyptian tourism operator — itineraries, availability, customer records and reservations in one system.

app.elfayrouz-traveleg.com →

Live

Digital Vet

A veterinary / AgriTech platform covering clinical reference, appointments and client communication — a domain where data structure matters more than styling.

digital-vet.com →

Live

Akalat

A two-sided marketplace connecting Egyptian home chefs with customers — storefronts, menus, ordering and fulfilment.

f6s.com/company/akalat-eg →

Invoicing & revenue system — in production. Project and milestone tracking, multi-currency contracts, change requests with deposits, and staged revenue recognition.

Mobile applications — customer dashboard, order tracking timeline and account management, built against the same API layer as the web product.

Where our work has shipped

We are not industry-locked, but we have real production experience in domains where data structure, money and operations matter as much as the interface.

Travel & tourism

Booking platforms, itineraries, availability and reservation operations.

Health & AgriTech

Clinical knowledge tools and practice systems where history and accuracy matter.

FinOps & SaaS

Invoicing, multi-currency contracts, milestones and revenue recognition.

Marketplace & commerce

Two-sided platforms: suppliers, storefronts, ordering and fulfilment flows.

Mobile products

Customer dashboards, order tracking and account experiences on device.

Operations software

Internal dashboards that cut manual work and make the status of work visible.

What clients can count on

You own everything

Source code, documentation and designs are yours. Delivered into your repository and your infrastructure — no proprietary lock-in, no licence tied to us.

Mainstream stack

We build on technologies any competent engineer can pick up — so the work survives beyond the engagement and does not depend on a single vendor or exotic framework.

Business outcomes first

Interfaces matter, but so do unit economics, operations hours and whether the system still runs when we are gone. We design for all three.

Honest scope

We would rather shrink a promise than inflate a timeline. What we commit to ship is what we intend to put into production — documented, handed over and reviewable.

08 — CONTACT

Let's talk about what you need to build

Whether you need a new product, a systems overhaul, or a partner who can take a messy operation and turn it into software your team can run — we are ready for a serious conversation.
